RESEARCH

Job Market Paper:

'The complexity of being fair'.

People adhere to distinct fairness views, but the understanding about the sources of such disagreement is still limited. In this paper, I focus on the complexity costs of implementing each view. I explore how fairness develops as children enter into adolescence, a period of relevant cognition change. I report from an experiment conducted with school students aged between 10 and 15. In the experiment, children decide how to distribute money between workers who completed tasks for different piece-rate payments. As children grow up, they increasingly take into account the unequal opportunities faced by the workers. I find that cognitive maturity is part of the explanation. Older and more able children are better at dealing with the complex procedures it implies: inferring counterfactual choices and incorporating them into their decisions. This leads to increased assignments for low-paid workers among meritocrats. I provide evidence on the role of the information used in their decisions. I show that drawing attention to the unequal opportunities yields no overall effect, but disclosing counterfactual choices helps closing the assignment gap across fairness views. These findings highlight the role of procedural choice on fairness adherence and introduce cognition as an additional determinant for fairness pluralism.
